

Installing on Debian 6 (Squeeze)

Overview

Installing MindTouch on Debian using the pre-configured package

Goal

After completing this tutorial you will have a MindTouch installation running natively on Debian Squeeze

System Requirements (Click to Expand) ▾

Add the MindTouch repository

The following commands should be run as "root" (or as a user with root privileges)

Edit the `/etc/apt/sources.list` file to add the following line :

Debian Squeeze:

```
deb http://repo.mindtouch.com/ Debian_6.0/
```

Also in that file, you'll need to add the following lines:

```
deb http://ftp.debian.org/debian/ squeeze main non-free contrib
deb-src http://ftp.debian.org/debian/ squeeze main non-free contrib
```

Type the following command to update your package indexes:

```
apt-get update
```

Install Dependencies

To enable full functionality in MindTouch, install dependencies by entering the following commands:

```
apt-get install html2text poppler-utils ttf-mscorefonts-installer cabextract  
mysql-server
```

Install/Upgrade Mono (Click to Expand) ▾

Install PrinceXML

To enable HTML-to-PDF printing, PrinceXML must be installed by entering the following commands:

32 bit install

```
wget http://www.princexml.com/download/prince_7.1-1_i386.deb  
dpkg -i prince_7.1-1_i386.deb
```

64 bit install

```
wget http://www.princexml.com/download/prince-7.1-linux.tar.gz  
tar -xzvf prince-7.1-linux.tar.gz  
cd prince-7.1-linux  
sudo ./install.sh
```

Hit Enter when asked for the install directory location

Install MindTouch

Install **MindTouch** using the following command :

```
apt-get install mindtouch
```

Note: Installation of some dependencies may require interaction. Answer "yes" to all authentication/verification questions including that the package cannot be authenticated.

Configure the Apache Virtual Host

After the install has finished, edit `/etc/apache2/sites-available/dekiwiki` and change the **ServerName** to match the hostname that you will be entering into the web browser to arrive at your wiki. This will allow the Apache virtual host to direct traffic to MindTouch.

Enter the following command to enable MindTouch in Apache and disable the initial default site:

```
a2ensite dekiwiki
a2dissite default
```

Once that has been done, enter the following line to reload Apache:

```
/etc/init.d/apache2 reload
```

Go to `http://your_server/config/index.php` to complete the configuration.

Web Installer

When you load the IP address for the MindTouch install it will present you with the following web installer where you can click **INSTALL** next to the MindTouch product you want to install. In this documentation we will be selecting the MindTouch Core installation.

Clicking **INSTALL** next to MindTouch Core will then present you with the following screen where you need to fill out the highlighted fields. Once you have filled out the form then click **NEXT** at the bottom of the screen.

Configuration

Database Configuration

Database host

If your database server isn't on your web server, enter the name or IP address here.

Database name

The database must not exist.

Database user

If the database user already exists, the password will be reset.

Existing MySQL credentials

In order to install, MindTouch requires a MySQL user who can create database, stored procedures, and MySQL users. Usually this user is root. These credentials will not be stored - they will only be used during installation.

This will then take you to the following page which confirms that a license has been sent to you in an email. When you receive the email, save the .xml file that is attached to a location on your computer that you can easily access for the

next step. Run the commands listed in the black box in the server console. Then click **CONTINUE TO MINDTOUCH** to then apply your license to your installation.

This will then bring you to your Product Activation page in the Control panel where you will select **Choose File** to upload the xml license file that was emailed you.

Then click **Activate License** which will then show you the following screen:

You have now successfully installed MindTouch. Continue with our [Setup and Configuration](#) guide to get your MindTouch install ready for production.

What's Next

If you encounter issues with MindTouch not starting confirm the version of Mono by running `mono --version`. If it doesn't say 2.4.3, run the following:

```
mv mono mono.old
mv gmcs gmcs.old
ln -s /opt/mono-2.4/bin/mono /usr/bin/mono
ln -s /opt/mono-2.4/bin/gmcs /usr/bin/gmcs
```
