## MindTouch Releases First Service-Oriented Wiki

*Free open source platform for online communities and enterprise collaboration unveiled*

**San Diego, CA – July 24, 2007** – MindTouch today announced the immediate availability of Deki Wiki “Hayes”, a **freeopen source** wiki and application platform for communities and enterprises. MindTouch Deki Wiki is released under the GNU General Public License (GPL v2). For download and other information, visit [http://wiki.opengarden.org/Deki\\_Wiki/Release/Hayes](http://wiki.opengarden.org/Deki_Wiki/Release/Hayes).

“Deki Wiki ‘Hayes’ is a powerful platform for developers to bridge many disparate applications, databases or data stores,” said **Aaron Fulkerson**, co-founder and vice president of Products at MindTouch. “We’re also giving non-techie users the ability to create composite applications and data mashups, making this an excellent vehicle for social media creation and aggregation.”

Deki Wiki has an award-winning user interface and robust feature set that includes: WYSIWYG editing, advanced permissions, file versioning and indexing, image galleries, and more. Among its many new features is a comprehensive **API**, which allows Deki Wiki to integrate with other applications using XML, JSON or PHP. The API provides methods for operating on pages, files and users, enabling developers to extend their applications with wiki capabilities.

“MindTouch Deki Wiki delivers an innovative language agnostic application platform. Being built on Mono also makes Deki Wiki system agnostic,” said **Miguel de Icaza**, vice president for Developer Platforms at Novell and founder of the **Gnome** and **Mono** projects. “With Deki Wiki Hayes, MindTouch has combined the most flexible deployment options with the most advanced wiki feature set available.”

Also introduced is an innovative service-oriented extension model where Web applications and services become accessible through Deki Wiki. For example, an extension could be invoked to compute results in a table or visualized as a graph. Extensions, which can be hosted anywhere, can operate on content to present it in alternative formats. For example, content can easily be converted into images, charts, or graphs. Deki Wiki ships with several extension services including [Microsoft Windows Live services](#), maps, [Widgetbox widgets](#), photo effects, and more.

“Adding services, like Microsoft Windows Live Controls, as a built-in component to a wiki is super interesting; MindTouch Deki Wiki is truly breaking new ground,” said [George Moore](#), general manager, Windows Live Platform at Microsoft.

Other new features in Deki Wiki “Hayes” include:

- Support for multiple authentication services including [OpenLDAP](#), [Drupal](#), Active Directory, [Wordpress](#), and [Joomla](#)
- Full skinning and customization capabilities
- Tagging, chronological tagging, tag categories
- Commenting
- Media gallery and image tools
- Support for embedding rich media like videos and widgets
- [And more...](#)

Thousands of organizations have already deployed Deki Wiki and are reaping the benefits. Flexible and easy to use, it features an intuitive WYSIWYG editing experience, making Deki Wiki an ideal choice for intranets, extranets, and interactive web sites.
